- 12:00pm - 3:00pm Exhibit Open

Production & Maintenance Forum

Take a break from the pressure of urgent ship dates and equipment breakdowns to focus on innovations in packaging technology, as well as the skills and standard practices required to prevent emergencies and keep machines running at optimal levels. Backstage visits to machines at the SuperCorrExpo will be guided by the manufacturers, with insight provided by maintenance professional Craig Gast.

Participants will return to their own plants with a greater understanding of new and traditional technologies and how the standard practices (SOPs & Decision guides).

Make best practice your standard practice.

Hazmat Packaging: Rules & Responsibilities Under the HMR

Most box makers face the situation routinely: customers want them to supply "hazmat packaging" [4G, 11G, 50G boxes]; and these are good business opportunities often securing large or high margin accounts, but the HMR are complex and tangential to your core business expertise.

- ⇒ **What are your responsibilities under the HMR?**
- ⇒ **How do we get this right?**
- ⇒ **What are the risks?**

This seminar focuses on three categories of specific regulatory issues surrounding the roles of the box fabricator under the HMR for the tasks routinely performed on behalf of their hazmat customers and is designed to help answer the questions above, including strategies for compliance with the least internal friction. The fabrication of "hazmat" packaging can be profitable and can allow for the acquisition and retention of customers. Internal regulatory expertise can be used to maximize business opportunities while minimizing regulatory and business liability. And training is required by the regulations. This seminar is designed to achieve these ends.

Best Practices on the Corrugator

This course is designed to give an understanding of each element in the corrugating process, which will lead to higher productivity & profitability, better quality, reduce waste & downtime.

These and other questions will be answered during this course:

- ⇒ What are the current trends in corrugator operations?
- ⇒ What are the best pre- and post-print options?
- ⇒ Which properties of the raw material are vital to guarantee your board quality will be acceptable?
- ⇒ What's the best way to handle your finished product?
- ⇒ Which factors are going to limit your corrugator's production?
